48 Volt
PI31xx-0x-HVIZ

$48V_{IN}$ and 3.3 – $18V_{OUT}$, ZVS Isolated DC-DC Converter Modules

Product Description

The ZVS Isolated Converter Module Series consists of high-density isolated DC-DC converters implementing Zero-Voltage Switching topology.

The $48V_{IN}$ series operates over a wide input range of 36 – 75V with 3.3V and 12V output models and a narrower range of 41 – 57V at 18V output for PoE and other applications. Both model sets produce 60W of output power, yeilding an unprecedented power density of 400W/in^3.

Device	Output Voltage		I_{OUT} Max
	Set	Range	
PI3101-00-HVIZ	3.3V	2.97 – 3.63V	18A
PI3105-00-HVIZ	12V	9.6 – 13.2V	5A
PI3110-01-HVIZ	18V	16.2 – 19.8V	3.3A

These converter modules are surface mountable and only ~0.5in square in area achieving ~50% space reduction versus conventional solutions.

A switching frequency of 900kHz allows for small input and output filter components which further reduces the total size and cost of the overall system solution. The output voltage is sensed and fed back to the internal controller using a proprietary isolated magnetic feedback scheme which allows for high bandwidth and good common mode noise immunity.

The 48 Volt PI31xx series requires no external feedback compensation and offers a total solution with a minimum number of external components. A rich feature set is offered, including output voltage trim capability, output overvoltage protection, adjustable soft start, overcurrent protection with auto-restart, over and under input voltage lockout and a temperature monitoring and protection function that provides an analog voltage proportional to the die temperature as shut down and alarm capabilities.

Features & Benefits

- Efficiency up to 89%
- High switching frequency minimizes input filter requirements and reduces output capacitance
- Proprietary "Double-Clamped" ZVS Buck-Boost Topology
- Proprietary isolated magnetic feedback
- Small footprint (0.57in^2) enables PCB area savings
- Very low profile (0.265in)
- On/Off Control, positive logic
- Wide trim range +10/–20% for PI3105-00-HVIZ (+10/–10% for other models)
- Temperature Monitor (TM) & Overtemperature Protection (OTP)
- Input UVLO & OVLO and output OVP
- Overcurrent protection with auto restart
- Adjustable soft start
- $2250V_{DC}$ input-to-output isolation

Applications

- Space-Constrained Systems
- Isolated Board-Level Power
- Network Power Systems
- Telecommunications
- Distributed Power Architecture
- PoE – Power Over Ethernet
- IPoL – Isolated Point-of-Load Power

Package Information

- Surface Mountable 0.87 x 0.65 x 0.265in package
- Weight = 7.8 grams

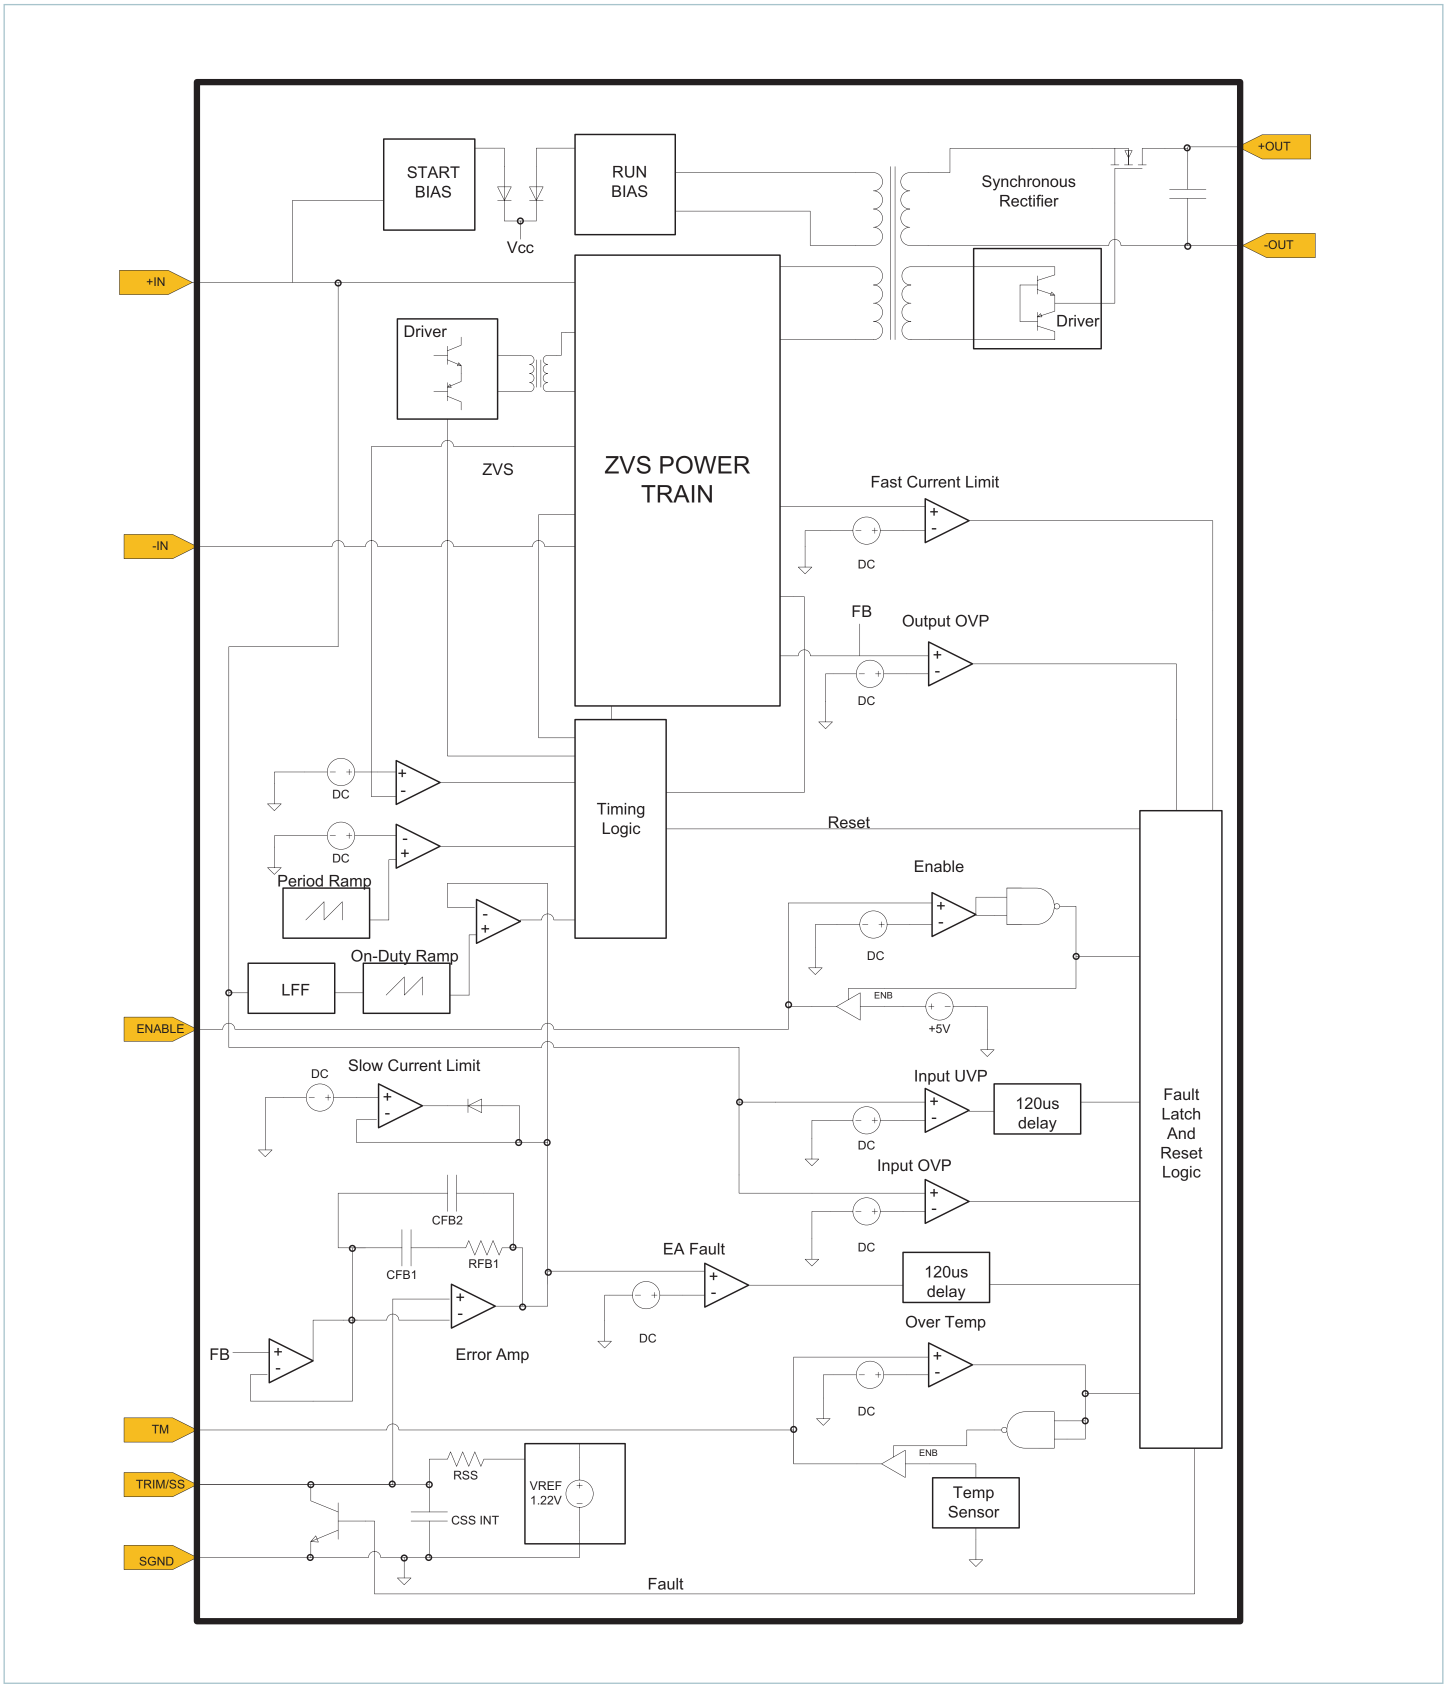
Functional Block Diagram



Pin Description

Pin Name	Description
+IN	Primary side positive input voltage terminals.
–IN	Primary side negative input voltage terminals.
ENABLE	Converter enable option, functions as 5V reference and on / off control pin. Pull low for off.
TRIM/SS	External soft-start pin and trim function. Connect to SGND or ENABLE through resistor for trim up or trim down.
TM	Temperature measurement output pin.
SGND	Signal ground, primary side referenced.
+OUT	Isolated secondary DC output voltage positive terminals.
–OUT	Isolated secondary DC output voltage negative terminals.

Package Pinout

Functional Description

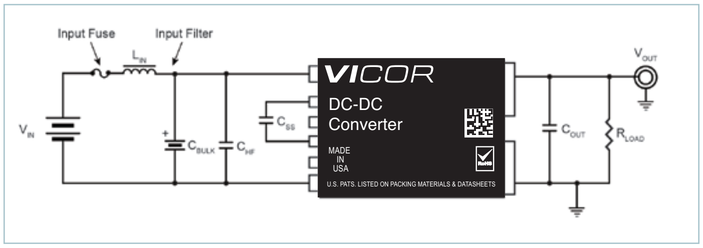

Figure 31 *— 48 Volt PI31xx shown with system fuse, filter, decoupling and extended soft start*

Input Power Pins IN(+) and IN(–)

The input power pins on the 48 Volt PI31xx are connected to the input power source which can range from 36 – 75V_{DC}. (PI3110-01-HVIZ 41 – 57V) Under surge conditions, the 48 Volt PI31xx can withstand up to 100V_{DC}. (PI3110-01-HVIZ 80V) for 100ms without incurring damage. The user should take care to avoid driving the input rails above the specified ratings. Since the 48 Volt PI31xx is designed with high reliability in mind, the input pins are continuously monitored. If the applied voltage exceeds the input overvoltage trip point the conversion process shall be terminated immediately. The converter initiates soft start automatically within 80ms after the input voltage is reduced back to the appropriate value. The input pins do not have reverse-polarity protection. If the 48 Volt PI31xx is operated in an environment where reverse polarity is a concern, the user should consider using a polarity protection device such as a suitably rated diode. To avoid the high losses of using a diode, the user should consider the much higher efficiency family of intelligent Cool-ORing® solutions that can be used in reverse-polarity applications. Information is available at vicorpower.com.

The 48 Volt PI31xx will draw nearly zero current until the input voltage reaches the internal start up threshold. If the ENABLE pin is not pulled low by external circuitry, the output voltage will begin rising to its final output value about 80ms after the input UV lockout releases. This will occur automatically even if the ENABLE pin is floating.

To help keep the source impedance low, the input to the 48 Volt PI31xx should be bypassed with (2) 1.0µF 100V ceramic capacitors of X7R dielectric in parallel with a low Q 47µF 100V electrolytic capacitor. To reduce EMI and reflected ripple current, a series inductor of 0.2 – 0.47µH can be added. The input traces to the module should be low impedance configured in such a manner as to keep stray inductance minimized.

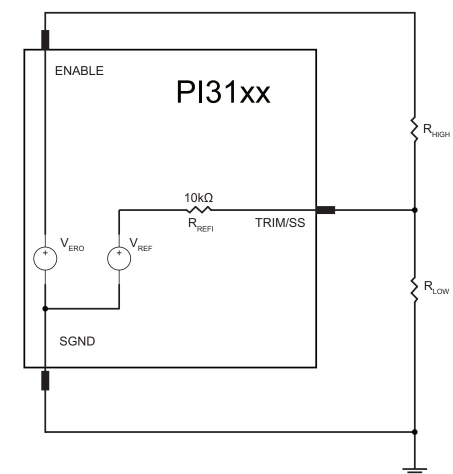
ENABLE

The ENABLE pin serves as a multi-function pin for the 48 Volt PI31xx. During normal operation, it outputs the on-board 4.9V regulator which can be used for trimming the module up. The ENABLE pin can also be used as a remote enable pin either from the secondary via an optocoupler and some external isolated bias supply or from the primary side through a small-signal transistor, FET or any device that sinks 3.3mA, minimum. If the ENABLE pin is lower than 2.35V typical, the converter will be held off or shut down if already operating. A third feature is offered in that during a fault condition such as output OVP, input UV or OV, or output current limit, the ENABLE pin is pulled low internally. This can be used as a signal to the user that a fault has occurred.

Whenever the ENABLE pin is pulled low, the TRIM/SS pin follows, resetting the internal and external soft-start circuitry. All faults will pull ENABLE low including overtemperature. If increased turn-on delay is desired, the ENABLE pin can be bypassed with a small capacitor up to a maximum of 1500pF.

TRIM/SS Pin

The TRIM/SS pin serves as another multi-purpose pin. First, it is used as the reference for the internal error amplifier. Connecting a resistor from TRIM/SS to SGND allows the reference to be margined down by as much as –20%. Connecting a resistor from TRIM/SS to ENABLE will allow the reference and output voltage to be margined up by 10%. If the user wishes a longer start up time, a small ceramic capacitor can be added to TRIM/SS to increase it. It is critical to connect any device between TRIM/SS and SGND and not –IN, otherwise high frequency noise will be introduced to the reference and possibly cause erratic operation. Referring to the figures below, the appropriate trim-up or trim-down resistor can be calculated using the equivalent circuit diagram and the equations. When trimming up the trim-down resistor is not populated and when trimming down, the trim-up resistor is not populated. The soft-start time is adjustable and has a default value of 500µs to reach steady state. The internal soft-start capacitor value is 10nF.



$$R_{LOW} = (-V_{DESIRED}) \bullet \frac{R_{REFI}}{(-V_{OUT\_NOM}) + V_{DESIRED}}$$

$$R_{HIGH} = (-R_{REFI}) \bullet \frac{(-V_{OUT\_NOM}) \bullet V_{ERO} + V_{DESIRED} \bullet V_{REF}}{V_{REF}\left((-V_{OUT\_NOM}) + V_{DESIRED}\right)}$$

Figure 32 *— Trim equations and equivalent circuit*

$$C_{REF} = \frac{T_{SS\_DESIRED} - 230 \bullet 10^{-6}}{23000}$$

TM

The TM pin serves as an output indicator of the internal package temperature which is within ±5°K of the hottest junction temperature. Because of this, it is a good indicator of a thermal overload condition. The output is a scaled, buffered analog voltage which indicates the internal temperature in degrees Kelvin. Upon a thermal overload, the TM pin is pulled low, indicating a thermal fault has occurred. Upon restart of the converter, the TM pin reverts back to a buffered monitor. The thermal shutdown function of the 48 Volt PI31xx is a fault feature which interrupts power processing if a certain maximum temperature is exceeded. TM can be monitored by an external microcontroller or circuit configured as an adaptive fan speed controller so that air flow in the system can be conveniently regulated.

SGND

The 48 Volt PI31xx SGND pin is the "quiet" control circuitry return. It is basically an extension of the internal signal ground. To avoid contamination and potential ground loops, this ground should NOT be connected to –IN since it is already star connected inside the package. Connect signal logic to SGND.

Output Power Pins +OUT and –OUT

The output power terminals OUT(+) and OUT(–) deliver the maximum output current from the 48 Volt PI31xx through the J-lead output pins. This configuration allows for a low impedance output and should be connected to multi-layer PCB parallel planes for best performance. Due to the high switching frequency, output ripple and noise can be easily attenuated by adding just a few high-quality X7R ceramic capacitors while retaining adequate transient response for most applications. The 48 Volt PI31xx does not require any feedback loop compensation nor does it require any opto-isolation. All isolation is contained within the package. This greatly simplifies the use of the converter and eliminates all outside influences of noise on the quality of the output voltage regulation and feedback loop. It is important for the user to minimize resistive connections from the load to the converter output and to keep stray inductance to a minimum for best regulation and transient response. The very small size footprint and height of the 48 Volt PI31xx allows the converter to be placed in the optimum location to allow for tight connections to the point-of-load.

Vicor's Standard Terms and Conditions and Product Warranty

All sales are subject to Vicor's Standard Terms and Conditions of Sale, and Product Warranty which are available on Vicor's webpage (http://www.vicorpower.com/termsconditionswarranty) or upon request.

Life Support Policy

VICOR'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF VICOR CORPORATION. As used herein, life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness. Per Vicor Terms and Conditions of Sale, the user of Vicor products and components in life support applications assumes all risks of such use and indemnifies Vicor against all liability and damages.
